

Cold storage compression

Rohit Goswami · 2025-07-26 · cmdline · compression

Recently some of my older publications were accepted and naturally were archived on the Materials Archive. That being said, local copies are also nice to have. The best compression I know of is basically via the [Lzma RZIP](#) :

```
lrzdir=gprd_sella_bench; \  
tar cvf $lrzdir.tar $lrzdir; \  
lrzip -Uvvp `nproc` \  
-S .lrz -L 9 $lrzdir.tar; \  
rm -fv $lrzdir.tar; unset lrzdir
```

Which should be decompressed with:

```
lrunzip -o - gprd_sella_bench.tar.bzip2-lrz | tar xvf -
```

Though I do hear good things about [7z](#) [too](#).
