

Lightweight C++ config with compile_flags.txt

Rohit Goswami · 2026-01-22 · cpp · config

For CMake driven C/C++ projects, `compile_commands.json` generation can be slightly painful, especially for mixed language projects [^fn:1]. A simpler route involves `clangd` support for `compile_flags.txt`, which includes simple newline-separated list of flags.

For my recent contributions to the mini-metatomic project, the file looked like this:

```
-I/usr/include/python3.13/  
-I./metatomic-core/include  
-fopenmp
```

Which allows LSP support in `emacs` to function correctly without a `compile_commands.json`.
