

Disabling Rust auto-formatting in Emacs per-project

Rohit Goswami · 2026-01-22 · emacs · rust

Sometimes aggressive auto-formatting (via `apheleia` or `rustic`) happens to be unwelcome for certain projects which prefer a more artisinal approach to semantics ^[^fn:1]. Disabling this generally requires setting directory-local variables.

I found it necessary to inhibit `apheleia` and disable LSP formatting to prevent the editor from mangling the code on save.

```
;; .dir-locals.el
((rustic-mode . ((rustic-format-on-save . nil)
                  (eval . (setq-local +format-with-lsp nil)))))
((nil . ((eval . (progn
                  (setq-local apheleia-inhibit t)
                  (setq-local rustic-format-on-save nil)
                  (setq-local +format-with-lsp nil)))))
```

Probably ought to be a nicer way, perhaps something in the `doom` local configuration.
