

Docker Development Environments

Rohit Goswami · 2021-11-24 · devenv · cmdline

Very quick set of ugly commands to grab build environments. A much better approach is to make a custom Dockerfile or even better, use `nix`.

However it does work in a pinch.

```
docker pull IMG:TAG
sudo docker run -v LOCALDIR:DIRINDOCKER -it debian:experimental-20211115 bash
# Don't be root for long
apt update
apt install sudo vim zsh
# Use the same username --> easier to manage permissions
useradd -m -s /bin/zsh $USER -G sudo
passwd $USER # Some crap
# Or just add to the sudoers file
echo "$USER ALL=(ALL:ALL) ALL" >> /etc/sudoers
su $USER
# numpy stuff
sudo apt install gcc gfortran libopenblas-dev python3.10-dev python3.10-dbg git python3-distutils python3-setuptools libx11-dev build-essential pkg-config python3-pip python3-pytest python3-hypothesis python3.10-dbg runtests.py -s f2py -vvv
```
