

Handling environments with cibuildwheel

Rohit Goswami · 2025-07-19 · ci

As kanged from NumPy.

```
set -xe
# Kanged from NumPy:
# https://github.com/numpy/numpy/blob/main/tools/wheels/cibw_before_build.sh

# remove any cruft from a previous run
rm -rf build

# TODO: delete along with enabling build isolation by unsetting
# CIBW_BUILD_FRONTEND when numpy is buildable under free-threaded
# python with a released version of cython
FREE_THREADED_BUILD="$(python -c"import sysconfig; print(bool(sysconfig.get_config_var('Py_GIL_DISABLED')))"")"
if [[ $FREE_THREADED_BUILD == "True" ]]; then
    python -m pip install setuptools
    python -m pip install -i https://pypi.anaconda.org/scientific-python-nightly-wheels/simple cython numpy
fi
```

Which works quite nicely, just from within the `pyproject.toml`.

```
[tool.cibuildwheel]
before-build = "bash {project}/tools/wheels/cibw_before_build.sh {project}"
```

Helpfully this also can be used to set variables and propagate things based on other conditions like operating systems.
