

Taming Github Notifications

Rohit Goswami · 2020-02-12 · tools · github · workflow

Background

As a member of several large organizations, I get a lot of github notifications. Not all of these are of relevance to me. This is especially true of `psuedo-monorepo` style repositories like the [JOSS review system](#) and **especially** the [exercism community](#).

- I recently (re-)joined the [exercism community](#) as a maintainer for the C++ lessons after having been a (sporadic) teacher
- This was largely in response to a community call to action as the group needed new blood to usher in **v3** of the exercism project

Anyway, I have since found that at the small cost of possibly much of my public repo data, I can manage my notifications better with [Octobox](#)

Octobox

- It appears to be free for now
- It syncs on demand (useful)
- I can search things quite easily
- They have a neat logo
- There appear to be many features I probably won't use

It looks like this:
