

GUI desktop files and tmux sessions

Rohit Goswami · 2025-07-19 · cmdline · gui · tmux

I was having trouble launching `ovito` from a desktop file. To send commands through to a new `tmux` session and then close it out I ended up with.

```
[Desktop Entry]
Name=OVITO
Type=Application
Exec=/usr/bin/tmux new-session -d -s ovito "bash --init-file <(echo '$HOME/.local/bin/ovito && tmux kill-session -t ovito')"
Icon=ovito
Terminal=false
StartupNotify=false
Categories=Education;Science;Mathematics;
Comment=Open Visualization Tool
```

So basically create a named session, run a `bash` instance, then kill the session at the end of it. Without the `bash` session, `tmux` exits immediately after executing `ovito`.

One caveat is that it only works for a single instance at a time.
