

julia and the conda libraries

Rohit Goswami · 2026-02-17 · julia · packaging · conda

Environments with `julia` often seem to have trouble with `Pkg.install()` and other commands with

```
ERROR: Unable to load dependent library /path/to/project/.pixi/envs/docs/bin/../lib/julia/libopenlibm.so
Message:/path/to/project/.pixi/envs/docs/bin/../lib/julia/libopenlibm.so: cannot enable executable stack as
shared object requires: Invalid argument
```

Not sure why this happens yet, but the fix is:

```
# needs to be set for each env!
execstack -c ../.pixi/envs/default/lib/julia/libopenlibm.so
# e.g. for a doc env...
execstack -c ../.pixi/envs/doc/lib/julia/libopenlibm.so
```
