

Faster manual tests with popd

Rohit Goswami · 2023-11-19 · devenv · cmdline

Both NumPy and SciPy use `spin` as a frontend to call `meson` and this can be used to setup a shell. The good thing is that invoking `exit` will return to the directory from which `spin` was run. To toggle between directories (e.g. a folder with a bug / issue repro) and the rebuild quickly `popd` is useful.

```
# Generate repro for bug
cd ~/Git/Github/BuggyNP/gh2322/
vim buggy.f90
python whatever.py
# whatever to reproduce the bug
cd ~/Git/Github/NumPy
# Make changes, rebuild
spin run $SHELL
popd
# returned to the gh2322 folder, test
python whatever.py
exit
# returns to NumPy root
vim README.md
spin run $SHELL
popd
# and so on...
```

Naturally these tools, and `popd` is more general and can be used for a lot more but this is pretty nifty too.
