

Notify on pdf compilation

Rohit Goswami · 2025-10-04

Watching a pdf render from org-mode generated tex files is an exercise in futility. A simple watchexec command with a notifier is much nicer.

```
watchexec \  
-e tex -e bib \  
-- \  
sh -c '  
  # Main source file – change this if you compile a different document.  
  src="rgDraft_I.tex"  
  pdf="${src%.tex}.pdf"  
  
  # Run Tectonic with shell-escape enabled.  
  if tectonic -X compile -Z shell-escape "$src"; then  
    notify-send \  
      -u normal \  
      -i document-save \  
      "✅ TeX compiled" \  
      "$pdf ready"  
  else  
    notify-send \  
      -u critical \  
      -i document-save-as \  
      "❌ TeX compilation failed" \  
      "Check terminal for error messages"  
  fi  
,
```

Could become a more full fledged script later.
