

# conda-smithy notes for off-brand conda packages

Rohit Goswami · 2026-02-01 · build · packaging · conda

## Migrations

For dependency resolution and CI workflow snippet generation, rather than hard-code dependencies, often we prefer “migration” files, as discussed in [the knowledge base](#). Most commonly these define version constraints, and are `conda smithy rerender`’d to ensure maximum compatibility.

Instead of using the upstream variants, these may also be defined by hand. For instance, consider handling an update to PyTorch 2.9 (e.g. from this [GROMACS metatomic package](#)):

```
# .ci_support/migrations/pytorch29.yaml
__migrator:
  build_number: 1
  kind: version
  migration_number: 1
libtorch:
- '2.9'
pytorch:
- '2.9'
```

Which can be applied to a package outside the `conda-forge` ecosystem via:

```
conda smithy rerender
```
