

pixi global environments consistent formatting

Rohit Goswami · 2025-09-25 · tools · R · pixi

Formatting `R` code which is typically managed in per-project environments can be quite annoying [^fn:1]. For formatting, defining a global environment with `pixi` makes life easier.

```
pixi global add --environment r_env r-styler --expose pixiR=R
```

This globally managed renamed `R` executable can then be used for `apheleia` in `doom` or in scripts:

```
(set-formatter!  
  'rstyler  
  '("pixiR" "-s" "--no-save" "--no-restore" "-e" "styler::style_text(readLines(file('stdin')))"  
  :modes '(ess-r-mode))
```

Which works well, isolating the formatting logic from transient per-project states and fragile global state.
