

Co-authoring Github commits with pixi

Rohit Goswami · 2026-02-05 · git · pixi · workflow

Seth Larson has a nice [short post](#) on handling co-authors on Github without public emails, basically using `jq` to generate the `noreply` email address.

For systems without `jq` or administrative access, augmenting this with `pixi` as the [shebang](#) works well [^fn:1]:

```
#!/usr/bin/env -S pixi exec --spec jq -- bash

# From https://sethmlarson.dev/easy-github-co-authored-by
# xref: https://github.com/awesomebytes/pixibang

login="$@"
read id display_name < <(echo $(curl -s "https://api.github.com/users/$login" | jq -r '.id, .name'))
echo "Co-authored-by: $display_name <$id+$login@users.noreply.github.com>"
```

Which works as expected:

```
ghcoauthby HaoZeke
Co-authored-by: Rohit Goswami <4336207+HaoZeke@users.noreply.github.com>
# more practically
git commit -m 'feat(mta): add amazing thing' \
  --trailer '$(coauthoredby HaoZeke)'
```
