

# Poetry and Direnv

Rohit Goswami · 2020-02-13 · tools · direnv · workflow · python

## Background

- I end up writing about using [poetry](#) a lot
- I almost always [use direnv](#) in real life too
- I don't keep writing mini scripts in my `.envrc`

Honestly there's nothing here anyone using the [direnv wiki](#) will find surprising, but then it is still neat to link back to.

## Setting Up Poetry

This essentially works by simply modifying the global `.direnvrc` which essentially gets sourced by every local `.envrc` anyway.

```
vim $HOME/.direnvrc
```

So what we put in there is the following snippet derived from other snippets [on the wiki](#), and is actually now there too.

```
# PUT this here
layout_poetry() {
  if [[ ! -f pyproject.toml ]]; then
    log_error 'No pyproject.toml found. Use `poetry new` or `poetry init` to create one first.'
    exit 2
  fi

  local VENV=$(dirname $(poetry run which python))
  export VIRTUAL_ENV=$(echo "$VENV" | rev | cut -d '/' -f2- | rev)
  export POETRY_ACTIVE=1
  PATH_add "$VENV"
}
```

Now we can just make `.envrc` files with `layout_poetry` and everything will *just work*™.
