

reMarkable Screen Sharing

Rohit Goswami · 2024-06-15 · devenv · cmdline · ssh · collab

Basically followed along the directions for [reStream](#) [^fn:1].

- Got the SSH root password and IP from Settings > Help > Copyrights and licenses > General information (scroll to the bottom)
- Added the IP to the pass store via `pass insert REMARKABLE_IP`
 - Queried via `pass REMARKABLE_IP`
- Added an `ecdsa` key, `ssh-keygen -t ecdsa -C "MYMAIL" -f ~/.ssh/remarkable`
 - `ssh-copy-id -i ~/.ssh/remarkable root@$(pass REMARKABLE_IP)`

The only slight point of deviation was using `chezmoi` to grab the local script [^fn:2]:

```
{{ if ne .chezmoi.os "windows" -}}
zinit ice from"gh-r" as"program" bpick"*.sh" mv"restream.sh -> reStream"
zinit light rien/reStream
{{ end -}}
```

Setting the actual binary on the reMarkable was also by the book (very thorough instructions):

```
scp restream.arm.static root@$(pass REMARKABLE_IP):/home/root/restream
ssh root@$(pass REMARKABLE_IP) 'chmod +x /home/root/restream'
```

With this, finally getting the shared window is a snap, as seen in Figure :

```
REMARKABLE_IP=$(pass REMARKABLE_IP) reStream -p
```

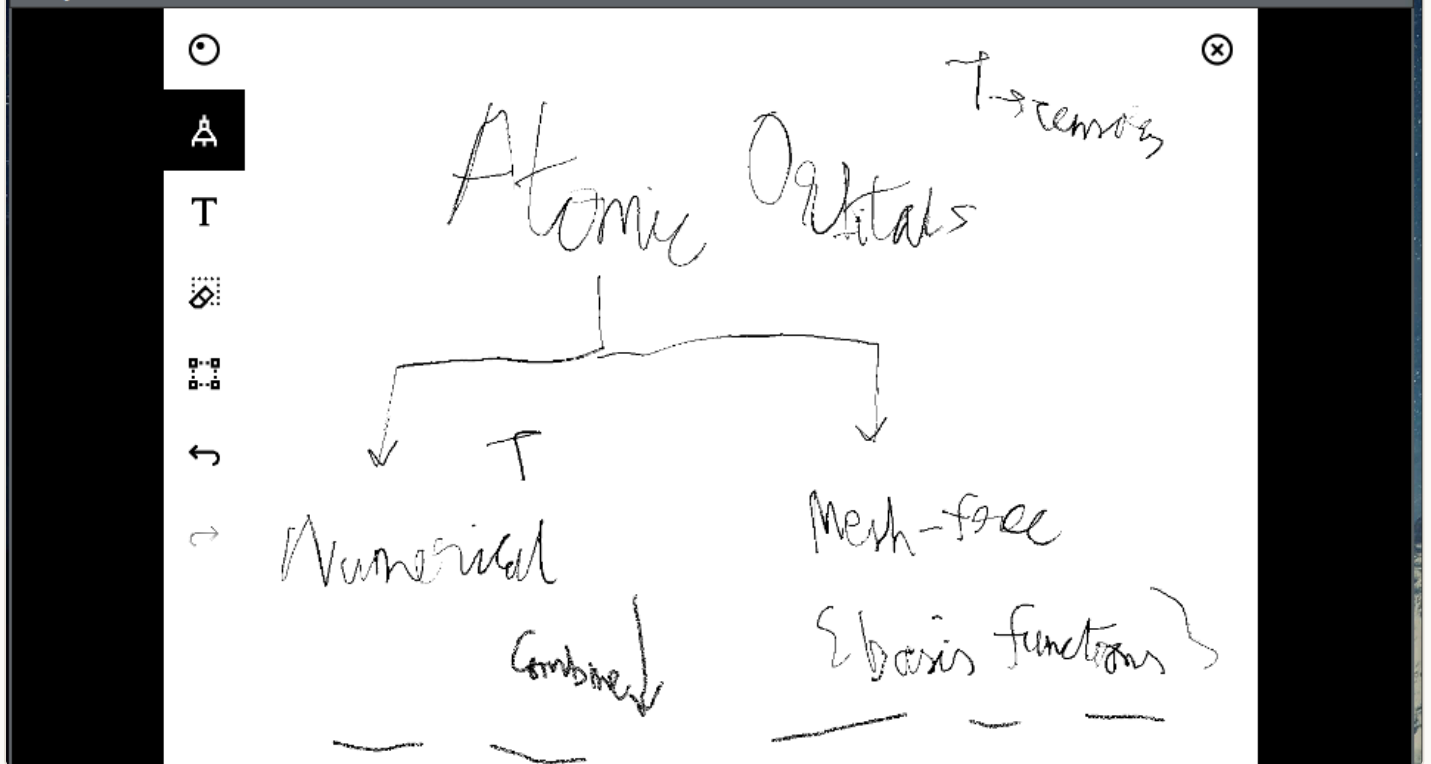

Figure 1: Success!!! No clue what I was scribbling though..
