Blurb:

We introduce `bless`, a tool geared towards multiple runs of codes in flux. The idea is to use Rust's logging libraries to transparently annotate outputs and additionally use a MongoDB database to store the output and metadata. We find this raises interesting problems while handling the outputs of MPI commands asynchronously. Additionally we provide alternatives to `(PROG 2>&1)`

tee `blah.out`, with the ability to use a configuration file and prepare a `tar.gz` of outputs and inputs. This is invaluable when working with minor changes to multiple codebases, as is typical in the early stages of a scientific project.
