

SSH Port Forwarding

Rohit Goswami · 2021-11-24 · ssh

Whenever I need to access a server running on an HPC which does not support `ngrok` or `localtunnel` or even `gsocket` ; the fallback approach is always to rely on SSH port forwarding.

The sample problem here is running an HTTP server for viewing graphics in R via `httpgd` .

```
# Local
export PORT=9899 && ssh -L "${PORT}:localhost:${PORT}" "rog32@krafla.rhi.hi.is" -N -L
"${PORT}:localhost:${PORT}" elja
# New tab
ssh krafla
ssh elja
radian # or R
```

Now in `R` .

```
library("httpgd")
# else install.packages(c("httpgd"), repos='https://cran.hafro.is/')
hgd(port=9899)
```

Conda and R

Annoyingly if you are depending on `conda` or `micromamba` or some variant thereof on the remote sever then `install.packages` will fail and instead the environment needs to have the corresponding `R` packages installed after searching anaconda.org.

```
# minimal
micromamba create -p $(pwd)/.tmp -c conda-forge r-tidyverse git R
micromamba activate $(pwd)/.tmp
micromamba install -c nclibz r-httpgd
```

These issues are not present when using a `nix-shell` .
