

Terminal Slack with Pidgin

Rohit Goswami · 2025-07-26 · cmdline · communication

Slack is unusable. Pidgin and Finch are marginally better. [slack-libpurple](#) works with a password generated from the Local Storage and Cookies of a browser session as follows [^fn:1]:

- Get the main token (`$MAIN`) via devtools->Application->Storage->Local Storage (search for `xoxc -`)
 - Search for `xoxc` then find it under `localConfig_v2/teams/token`
- Get the Cookies `d` token (`$COOKIE`) from:
 - devtools->Application->Storage->Cookies-> `d`

Join them together with a space so it is `$MAIN $COOKIE` and use that as the password for Pidgin.
